36                  John Engel – HDR (by phone/WebEx)

37  
38                  **Welcome and Administrative**

39                  Introductions were made. There were no agenda modifications. **The November WAC Minutes**  
40                  **were approved with no modifications.**

41  
42                  **WAP Update Report Finalization**

43                  Courtney discussed edits made to the WAP Update document to address WAC member

44 comments. **Wyoming project routing still needs to be modified pending input from**  
45 **Wyoming. Altenhofen asked that the NE Ground Water Recharge project description be**  
46 **updated based upon new information and to describe overlap with the Nebraska Ground**  
47 **Water Management project, and the ED Office agreed. Altenhofen also suggested that the**  
48 **footnote on page 7 should be revised** to clarify that the Appendix A-5 versus Appendix E issue  
49 is considering to be investigated by the Scoring Subcommittee being undertaken per Governance  
50 Committee (GC) direction. Altenhofen noted that Tamarack I was originally scored based upon  
51 fixed daily targets of 3,000 cfs in May/June, not even 3,400 cfs. Then over time this changed  
52 from 3,000 to 3,400 to 4,900 cfs for certain days. Altenhofen also noted that the 4,900 cfs is  
53 really like a short duration high flow (SDHF) if you go back and read through the history of  
54 target flow development. Altenhofen indicated that the 4,900 cfs may not be appropriate for  
55 determining excess flows that can be stored but is more appropriate for determining releases.  
56 The group agreed that this is work for the Scoring Subcommittee. Courtney clarified that WAP  
57 project scoring will be a separate exercise from the work done in reregulating reservoir project  
58 feasibility, though information from feasibility is important to scoring. Besson motioned to  
59 approve the document pending the modifications discussed above and that the **WAC receive an**  
60 **updated version prior to it being sent to the GC.** Strauch seconded the motion. **The WAC**  
61 **approved the WAP Update provided that the changes discussed above are made.**

62  
63 **WAP Permitting Update** Kenny reported on recent conversations with the Army Corps of  
64 Engineers (COE). All in-channel work could be done via Nationwide Permits #27. The ED  
65 Office has also discussed other WAP projects with the COE, particularly the Elm Creek and J-2  
66 reregulating reservoir projects. Off-channel reservoir permitting tends to be easier, so Elm Creek  
67 would likely receive greater scrutiny as would a J-2 reservoir impacting Plum Creek. The COE  
68 thinks an EIS is probably not necessary and that we can likely tier off of the Programmatic EIS.  
69 Nevertheless, CWA Section 401(b)(1) must be dealt with to demonstrate the alternative is the  
70 least environmentally damaging practical alternative. The Purpose and Need for these reservoirs  
71 needs to be carefully crafted to focus the alternatives analysis to discuss SDHF, hydrocycling  
72 mitigation, and target flow purposes. Early conversations with the COE and all other permitting  
73 and regulatory entities is important. The ED Office has a tentatively scheduled meeting in late  
74 March with the COE, Environmental Protection Agency (EPA), Nebraska Game and Parks  
75 Commission (NGPC), Nebraska Department of Environmental Quality (NDEQ), the Fish and  
76 Wildlife Service (FWS) and possibly others to discuss potential Program actions. Kenny also  
77 noted that there are some activities that we'd like to start doing now related to permitting, for  
78 example wetland delineation, to capitalize on specific time windows when the work can be  
79 accomplished.

#### 80 81 **CNPPID Reregulating Reservoir Phase I Final Report**

82 Olsson will make a few minor edits to the report in response to new comments provided by  
83 Besson and Altenhofen. Steinke requested that the WAC approve the final report. Altenhofen  
84 made the motion and Williams seconded. **The WAC approved the final report provided that**  
85 **the edits noted above are made.**

87 **CNPPID Reregulating Reservoir Phase II Scope**

88 Courtney told the group that following the Olsson Phase I Reregulating Reservoir presentation to  
89 the GC in December, the GC expressed concern about approving the next phase of feasibility  
90 prior to the WAC approving the final report and prior to having an agreement between the  
91 Program and CNPPID. Recognizing seasonal constraints (ground frozen, pre-irrigation season),  
92 the GC directed the field work portion of the next phase be provided in a separate scope for  
93 approval at a special GC meeting on February 25, with any subsequent work to potentially be  
94 approved at a later date.

95  
96 A WAC workgroup meeting was held with Olsson and the ED Office in January to discuss  
97 potential incremental benefits of combinations of projects and project configurations that hadn't  
98 been considered in Phase I, prior to embarking on full feasibility. For example, some  
99 significantly lower-cost alternatives were identified which would utilize Elwood Reservoir to  
100 supplement a Short Duration High Flow that would be primarily achieved with J2 Reregulating  
101 Reservoir – this was not analyzed in Phase I but may provide an attractive cost-effective option.

102  
103 Two draft scopes of service from Olsson were provided to the WAC, one for the field work and  
104 one for this intermediate/incremental step to be completed prior to full feasibility. Courtney also  
105 discussed concurrent related work being conducted by the ED Office working with the GC  
106 Scoring Subcommittee. The group discussed the proposed intermediate step budget in Olsson's  
107 draft contract (\$141,531) and the impact on the full feasibility budget (total reregulating  
108 reservoirs budget is \$750,000). Courtney noted that one of the most time intensive portions of  
109 Olsson's Phase II work would be if we brought many alternatives forward and need to complete  
110 full hydrologic/operations analysis on them all. This intermediate phase is intended to cut down  
111 on alternatives to reduce uncertainty and streamline the next phase. Altenhofen expressed  
112 concern about only using three representative year types in lieu of a continuous simulation  
113 period. Courtney noted that as part of the work it is completing for the GC Scoring  
114 Subcommittee, the ED Office has already run a continuous period using daily OPStudy  
115 hydrology (1947-1994, adjusted, three state). Belanger noted that the results are very  
116 comparative to Olsson's Phase I results and that the reservoir capacity appears to be the driver of  
117 the yield. **The ED Office will provide the WAC with the spreadsheet analysis once it has  
118 been approved by the GC Scoring Subcommittee.**

119  
120 Dove discussed the level of detail needed for the intermediate phase. Excel can be used but that  
121 is limited. HEC-ResSim could be used to start developing operations. Dove reviewed the pre-  
122 feasibility results which showed that the J-2 Alternative 2, Area 1 & 2 combination (which can  
123 provide three days of 2,000 cfs to augment SDHF) was the preferred alternative. He noted that  
124 Elwood could potentially be used to provide lower supplemental flows (~350 cfs) using existing  
125 inlet and outlet works and Plum Creek for delivery if used prior to Elwood being filled for  
126 irrigation season. Elwood could have target flow and SDHF augmentation benefits but there is  
127 power interference for two power stations (J-1 and J-2 hydros). The interaction and potential  
128 competition between projects/reservoirs for excess flows was discussed and will continue to be  
129 considered, as identified in the WAP Update Report.

130  
131 Dove reviewed the field work scope. Soil borings need to be completed while the ground is  
132 frozen. They would also like to complete wetland delineation in the spring. Altenhofen asked  
133 about initial reservoir storage content assumptions for this work. With this approach, Belanger  
134 would provide Olsson initial storage contents for the three representative years based upon the  
135 continuous simulation results from the work performed for the GC Scoring Subcommittee.  
136 Olsson will survey Phelps Canal and review new LiDAR data under the field work scope.  
137 Proposed boring locations were reviewed. A GC special session is scheduled for Feb 25 to  
138 approve of the field work contract. Dove noted there is no engineering analysis in the field work  
139 contract.

140  
141 Dove then reviewed the intermediate step (or “second”) contract which would analyze  
142 hydrology/operations for new alternatives. Initial permitting contacts will be made to determine  
143 potential design impacts. Ideally both contracts would be approved by the GC at the same time  
144 so work could be completed concurrently. Preliminary results could be presented at the May 11  
145 WAC meeting and a final memo completed in June or July. It may be possible to get a WAC  
146 recommendation for the GC in August to approve of the full feasibility phase. Dove also  
147 reviewed items that would be completed in feasibility.

148  
149 Altenhofen said that there seem to be inconsistencies/overlap between the two contracts. Dove  
150 clarified that the field work contract is generally for data collection with full data analysis and  
151 reporting under the second contract. Altenhofen asked about additional details regarding hours  
152 and costs and Kenny clarified that the ED Office has reviewed this information but did not  
153 attached it to the contract. Altenhofen pointed out that the number of cross sections are not  
154 consistent between the two contracts. Under Exhibit A of the field work contract, **Page 1**  
155 **Section 1.01 B. will be changed to seven rather than five cross sections to be consistent with**  
156 **the alternatives analysis contract, which will not increase the cost. Olsson will make this**  
157 **edit.** Altenhofen also asked about the language regarding land owner responsibility. **Dove noted**  
158 **that the intent was for the Program to be liable but agreed that the contract read as though**  
159 **the landowner is legally responsible so he will make edits to fix this in the field work**  
160 **contract. Dove also noted that paragraph 4 of Exhibit A of the intermediate phase contract**  
161 **will be removed in its entirety as this was moved to the field work contract.**

162  
163 Besson moved that the field work contract be approved. Shaffer seconded it. **The motion to**  
164 **approve the field work contract was approved provided that the modifications noted above**  
165 **are made.**

166  
167 The group then discussed the purpose of the second contract. Kenny said that the GC  
168 specifically requested to move ahead on the field work, so that is all the Finance Committee (FC)  
169 is being asked to approve tomorrow. Since the GC last met, the need for the intermediate step  
170 analysis has been identified by the ED Office and workgroup. Courtney said that this is almost a  
171 cost-benefit analysis of some other alternatives/configurations that hadn't been considered under  
172 Phase I. This information will define the alternatives that move forward to feasibility. The

173 intermediate step schedule and likelihood of getting the contract approved by the FC and GC was  
174 discussed.

175

176 The group then discussed the option of moving forward with a full feasibility scope. Courtney  
177 asked the group if they support the general concept of the intermediate phase. Besson asked if  
178 the group could recommend this intermediate phase concept to the GC but not put the contract  
179 forward. Altenhofen said no, he thinks this needs to come from the GC. Drain asked if the ED  
180 Office can propose this to the GC. Kenny said yes. Kwapnioski noted that there are a lot of  
181 politics involved in moving ahead to full feasibility and that it would be easier to identify some  
182 intermediate steps to move in this direction. Drain said that he thinks the WAC agrees that this  
183 work, however it is presented, needs to be done. Kwapnioski stressed the impact of not moving  
184 ahead with a somewhat aggressive schedule. Runge asked Olsson about Elwood winter use and  
185 if modifications would be needed and environmental implications. Dove said minimal  
186 improvements are envisioned but that this next step would evaluate if using Plum Creek will be  
187 carried forward and clear water impacts would be evaluated under full feasibility. Runge  
188 suggested introducing some of these concepts to the resource/permitting agencies when the ED  
189 Office meets with them in March. Dove and others noted that it may be too early for this as the  
190 alternatives need to be defined first.

191

192 Steinke asked if the group thinks that this next phase of work needs to be done to narrow down  
193 the alternatives prior to full feasibility. He also asked the group to recommend the concept of  
194 narrowing down/better defining alternatives but not to approve of the draft contract. The  
195 intermediate step contract was not approved but **the group agreed that the ED Office should**  
196 **present the concept of the intermediate step work to the GC. Altenhofen asked that a**  
197 **simple one page memo describing the work be provided to the WAC and then the GC. The**  
198 **group will provide Courtney with any specific items they would like to see included in the**  
199 **memo, which Olsson will develop.**

200

#### 201 **Groundwater Recharge/Management Pre-Feasibility Update**

202 Smith provided an update on the Nebraska groundwater recharge/management prefeasibility  
203 project. He noted that there are two Nebraska groundwater related projects in the WAP which  
204 are similar and/or could be operated together: Dawson/Gothenburg Canal groundwater recharge  
205 and Nebraska groundwater management. The two projects have significant areas of overlap, and  
206 concepts from the groundwater management project will be incorporated into the groundwater  
207 recharge project where beneficial. However, the two projects will remain separate projects.  
208 Smith reviewed the requirements used to identify six sites for pre-feasibility analyses for the  
209 November 2009 WAC meeting. He noted that he and Bill Hahn are working with a groundwater  
210 recharge technical work group which requested that additional project concepts be incorporated  
211 into the prefeasibility study, and that example project configurations and sample yield and costs  
212 estimates be developed for each groundwater recharge concept. Permitting issues should also be  
213 considered. Smith presented the four concepts including example project configurations and said  
214 they are developing cost and yield estimates for each of the four project concepts/configurations.  
215 Smith pointed out that the four concepts were developed with input from the groundwater

216 recharge technical work group, and that he believed that the working group agreed that these four  
217 concepts adequately represented the potential array of recharge operations. The only additional  
218 clarification provided by the technical work group was by Altenhofen, who noted that the  
219 Program should consider the potential for recharge occurring on Program owned lands with the  
220 added benefit of creating bird habitat (e.g., through recharge on wet meadows). He also noted  
221 that the concept of diverting excesses using alluvial wells and piping these diversions under I-80  
222 would be very difficult to get approved and may be prohibitively expensive. Hallum asked  
223 whether historical high groundwater levels associated with CPNRD recharge at B-1 Reservoir  
224 would pose a problem for the Program's concept of using B-1 Reservoir for additional recharge.  
225 Woodward responded that problems with high groundwater related to recharge at B-1 Reservoir  
226 have been shown not to be a result of recharge at the reservoir, but were a result of unusually wet  
227 years in the 1990s. Additionally, problems with high groundwater were not at the B-1 Reservoir  
228 site, but were more an issue west and southwest of Overton. Smith noted that the project  
229 workgroup will be doing some the ground reconnaissance in the near future. They have also  
230 been working with Ann Bleed, who is serving as a special advisor to the ED Office, to identify  
231 permitting issues and needs. Permitting issues and protecting water (in the river and in the  
232 aquifer) were discussed. A stakeholder group will likely be held in April with interested parties  
233 including DNR, NRDs, and power and irrigation districts. The stakeholder meeting will provide  
234 an opportunity for stakeholders to voice interest, concerns, and suggestions about the Program  
235 groundwater recharge concepts, and will include participation by Bleed. A feasibility study will  
236 be initiated after the current prefeasibility study is complete. Feasibility analyses will include  
237 site investigations to determine site specific information (recharge and pumping rates), refined  
238 cost estimates, and demonstration projects (small scale recharge projects to determine the  
239 feasibility of construction and implementation of the recharge and management concepts). The  
240 current project schedule anticipates a draft prefeasibility report and feasibility study RFP to the  
241 WAC in June and a final prefeasibility report and feasibility RFP to the WAC in July. If  
242 approved by the WAC, a feasibility study RFP will be provided to the GC in September.

243

#### 244 **Stage Change Study Update**

245 **Kenny reported that a draft report on the stage change study will be forwarded to the**  
246 **WAC by Courtney.** The stage change study was a hydrology/hydraulics investigation and did  
247 not include species response. The main hydrology question was what potential impacts upstream  
248 Program actions might have on lower Platte flows. The main finding is that it will be hard to see  
249 impacts of central and upper Platte activities on the lower Platte. Most of lower Platte flows are  
250 from the Elkhorn River and the Loup River. During low flow periods in the lower Platte,;  
251 however, impacts from diversions upstream are perceptible so the Program needs to be careful in  
252 operations of projects diverting excess flows during these periods. A 1-D model in HEC-RAS  
253 was developed for the study from the Elkhorn River to the confluence with the Missouri.. In  
254 addition a 2-D model of a smaller segment of the river (~1/4 mile) was developed to look in  
255 greater detail at micro-habitats in that portion of the river based upon depth and velocity. A  
256 presentation of results will be made to the GC in March.

257

258

259 **Water Management Incentives Scope**

260 Kenny had hoped that Tom Riley of the Flatwater Group would be presenting the draft scope but  
261 it isn't ready. He reminded the group that the water management WAP project reduces  
262 consumptive use and then returns these flows to the river. Investigating and quantifying yields is  
263 more vague for this project than for some other WAP projects because the contributions are not  
264 point sources. This will be a modeling exercise. The model most likely to be used is the  
265 conjunctive management modeling tool currently under development. This team will be led by  
266 Flatwater Group with input from experts at the University of Nebraska (UNL). The focus will  
267 be on areas below Lake McConaughy and within five miles of the river to have a more  
268 immediate impact on the habitat. The first phase will be information gathering followed by  
269 honing in on which practices are quantifiable and most likely to provide the biggest cost-benefit.  
270 Economics will be an important part of the prioritizing of projects. The ED Office is also  
271 watching similar work and research being done in Colorado. The WAC provided input on  
272 research, projects and workshops they are aware of that might be of interest. Kenny hopes to  
273 have a scope to bring forward to the WAC in May.

274

275 **1-D Hydraulic Model Update**

276 Smith told the group that there is a Program RFP out for a 1-D HEC-RAS model which closes  
277 this Friday (2/12). The hydraulics portion of the model will include the North Platte and Platte  
278 River from Lake McConaughy to Chapman, with sediment transport modeled from Lexington to  
279 Chapman. The Adaptive Management group is leading this but wants to keep the WAC updated  
280 on the project. Smith noted that there are several existing tools, but that these have limitations  
281 (including geographic coverage), so a new model is needed for central Platte areas of interest.  
282 The new model will be built and calibrated in the latest versions of HEC-RAS and HEC-  
283 GeoRAS, which are public domain platforms usable by all Program stakeholders. The model  
284 will evaluate river processes (ex: flow, flow attenuation, sediment transport) and impacts on  
285 Program habitat (ex: vegetation, sand bars, depth of flow). It will also be used as a design aid  
286 tool for Adaptive Management Plan (AMP) experiments and to predict experiment effects.  
287 There may be other uses related to WAP project evaluations. The model is expected to be  
288 completed by the end of the year and will be made available to stakeholders, including a training  
289 workshop.

290

291 **Additional Business**

292 There was no additional business. The next WAC meeting is scheduled for May 11 from 9:30  
293 a.m. to 3:00 p.m. in Ogallala. Annual depletions reports will be made at this meeting. No written  
294 reports are necessary.

295

296 The meeting was adjourned.

297

298 **Action Items**

299

300 **ED Office**

- 301 - Update the WAP Update with new Wyoming project routing once received
- 302 - Update the Nebraska Ground Water Recharge project description in the WAP Update based
- 303 upon new information and describe overlap with the Nebraska Ground Water Management
- 304 project
- 305 - Clarify footnote 8 on page 7
- 306 - Provide the WAC with updated version of the WAP Update prior to sending it to the GC
- 307 - Provide the WAC with the scoring spreadsheet analysis once it has been approved by the GC
- 308 Scoring Subcommittee
- 309 - Present the concept of the CNPPID reregulating reservoir feasibility intermediate step to the
- 310 GC. First develop a one page memo and provide to the WAC
- 311 - Forward draft stage change study report to the WAC

312

313 **General WAC**

- 314 - Provide Courtney with any specific items to be included in the GC CNPPID reregulating
- 315 reservoir feasibility intermediate step concept memo

316

317 **Wyoming**

- 318 - Provide updated Wyoming WAP project routing information to the ED Office for WAP
- 319 Update

320

321 **Olsson Associates**

- 322 - Make a final edits to the CNPPID reregulating reservoir project phase I report in response to
- 323 new comments received. Finalize report
- 324 - Under Exhibit A of the field work contract, change Page 1 Section 1.01 B. to seven rather
- 325 than five cross sections
- 326 - Edit the field work contract to clarify that the Program is legally responsible
- 327 - Remove paragraph 4 of Exhibit A of the intermediate phase contract in its entirety and move
- 328 to the field work contract
